

## PRIVATE INFRASTRUCTURE NETWORK ASSESSMENT

# ENGIE: the network on the site

On a renewable plant the network question is resilience: when the fibre is cut or stolen, does SCADA stay up, can the O&M crews still work across the site, and are the perimeter cameras still reporting? A standby wireless path that takes over automatically costs far less than one day of lost visibility.

**HALF A DAY ON SITE, WITH YOU**

- We walk the substation and control room, turbine strings, O&M buildings, perimeter cameras and existing fibre routes.
- What you have today: links, routers, contracts and the systems that depend on them.
- What fails, where and how often, from the people who deal with it.
- What it costs you, taken from your own invoices.
- Where a backbone can run and how a reliable uplink gets onto it: terrain, line of sight, high sites and power.

**WHAT YOU GET**

- A written report on the site: today's network, the gaps and the systems at risk.
- An owned network design: backbone, distribution and access, with standby paths.
- Feasibility, checked against the terrain before anyone prices a build.
- Indicative investment and payback, calculated from your own numbers.
- The report is yours to keep, whatever you decide.

## Cost of Disconnection vs Value of Connected Operations

|                                 | COST OF DISCONNECTION                                                              | VALUE OF CONNECTED OPERATIONS                            |
|---------------------------------|------------------------------------------------------------------------------------|----------------------------------------------------------|
| <b>Avoided loss</b>             | When the fibre is cut or stolen, SCADA and the perimeter cameras go dark together. | A standby wireless path that takes over automatically.   |
| <b>Operational efficiency</b>   | Crews lose time where cellular coverage is patchy.                                 | Turbine data and reporting available across the site.    |
| <b>Infrastructure ownership</b> | A single path with no owned fallback.                                              | An owned, monitored standby network under your control.  |
| <b>Executive risk reduction</b> | Lost visibility becomes an availability and reporting problem.                     | Evidence of resilience for the asset owner and the grid. |

**R3,500** ex VAT

Half-day on-site assessment, credited in full against the build.

**NEXT STEPS**

- 1 A 10-minute call to agree what matters most on the site.
- 2 We book the half day at a time that suits your team.
- 3 You receive the report, then decide whether to build. No obligation beyond the assessment.
